

D-town delinquents

What we found

A few other students and I were given the information from the Dallas Police Department for 2014-2015. We were tasked with using various data mining strategies to create a report in the style of one that could be given to the Dallas Police. I used various techniques, such as classification, association, and clustering to find trends and patterns in the data.

What we did

We did a study on theft crimes in various divisions in Dallas and found concrete data that gave us stories about where and why theft is predominant. It was important that we were able to present these findings in realistic and actionable ways, to provide steps to be further taken by the Dallas Police Department or any other stakeholder parties.
